Boosting: meta-algorithm using "weak" learning algorithm

Goal

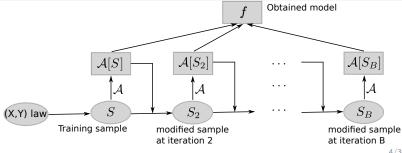

Build an accurate model using a "weak" learning algorithm ${\cal A}$

"Weak" learning algorithm

Learn a model that can do slightly better than a random guess Learning algorithm with high bias (and low variance)

Idea

Sequentially apply ${\mathcal A}$ on a repeatedly modified data to incrementally refine the model we build

"Weak" Learning Algorithm Used in This Illustration

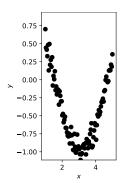

We have a learning algorithm \mathcal{A} such that: $\forall S, \ \mathcal{A}[S]$ returns γ minimizing $\sum_{(x,y)\in S} (y-\phi(x;\gamma))^2$

$$\text{Stump: } \phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x\leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x>\gamma^{(0)}}(x)$$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm \mathcal{A} such that: $\forall S, \ \mathcal{A}[S] \text{ returns } \gamma \text{ minimizing } \sum\limits_{(x,y) \in S} (y - \phi(x;\gamma))^2$

 $\text{Stump: } \phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x\leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x>\gamma^{(0)}}(x)$

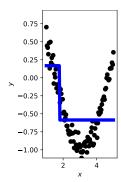

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm A such that: $\forall S, \ \mathcal{A}[S] \ \text{returns} \ \gamma \ \text{minimizing} \ \sum_{(x,y) \in S} (y - \phi(x;\gamma))^2$

Stump:
$$\phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x \leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x > \gamma^{(0)}}(x)$$

 $x \leqslant \gamma^{(0)}$

Model: $\phi(x; \gamma_1)$

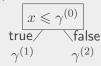

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \ \text{returns} \ \gamma \ \text{minimizing} \ \sum_{(x,y)\in S} (y-\phi(x;\gamma))^2$$

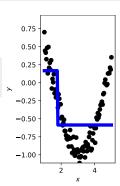

Stump:
$$\phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x\leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x>\gamma^{(0)}}(x)$$

Model: $\phi(x; \gamma_1) + \phi(x; \gamma_2)$

Idea

Add a corrective term $\phi(x, \gamma_2)$

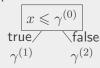

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \text{ returns } \gamma \text{ minimizing } \sum_{(x,y)\in S} (y-\phi(x;\gamma))^2$$

Stump: $\phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x\leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x>\gamma^{(0)}}(x)$

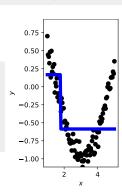

Model: $\phi(x; \gamma_1) + \phi(x; \gamma_2)$

Idea

Add a corrective term $\phi(x, \gamma_2)$

Choose $\phi(x, \gamma_2)$ minimizing:

$$\sum_{(x,y)\in S} (y - \phi(x;\gamma_1) - \phi(x;\gamma_2))^2$$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \text{ returns } \gamma \text{ minimizing } \sum_{(x,y) \in S} (y - \phi(x;\gamma))^2$$

$$\text{Stump: } \phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x \leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x > \gamma^{(0)}}(x)$$

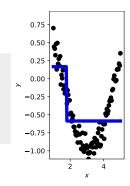

Model: $\phi(x; \gamma_1) + \phi(x; \gamma_2)$

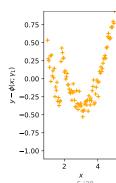

ldea

Add a corrective term $\phi(x,\gamma_2)$

Choose $\phi(x,\gamma_2)$ minimizing:

$$\sum_{(x,y)\in S} (y - \phi(x;\gamma_1) - \phi(x;\gamma_2))^2$$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \ \text{returns} \ \gamma \ \text{minimizing} \ \sum \ (y - \phi(x; \gamma))^2$$

Stump:
$$\phi(x;\gamma) = \gamma^{(1)} \mathbb{1}_{x \leq \gamma^{(0)}}(x) + \gamma^{(2)} \mathbb{1}_{x > \gamma^{(0)}}(x)$$

Model:
$$\phi(x; \gamma_1) + \phi(x; \gamma_2)$$

Idea

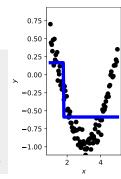

Add a corrective term $\phi(x,\gamma_2)$

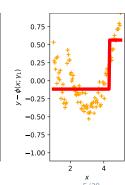

Choose $\phi(x, \gamma_2)$ minimizing:

$$\sum_{(x,y)\in S} (y - \phi(x; \gamma_1) - \phi(x; \gamma_2))^2$$

Use \mathcal{A} on S_2 to get $\phi(x; \gamma_2)$:

$$S_2 = \{(x, y - \phi(x; \gamma_1)) | (x, y) \in S\}$$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \ \text{returns} \ \gamma \ \text{minimizing} \quad \sum \ (y - \phi(x; \gamma))^2$$

Stump:
$$\phi(x;\gamma) = \gamma^{(1)} \mathbb{1}_{x \leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbb{1}_{x > \gamma^{(0)}}(x)$$

Model:
$$\phi(x; \gamma_1) + \phi(x; \gamma_2)$$

ldea

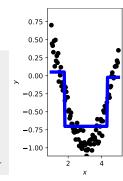

Add a corrective term $\phi(x,\gamma_2)$

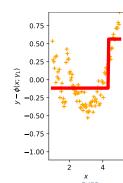

Choose $\phi(x, \gamma_2)$ minimizing:

$$\sum_{(x,y)\in S} (y - \phi(x;\gamma_1) - \phi(x;\gamma_2))^2$$

Use \mathcal{A} on S_2 to get $\phi(x; \gamma_2)$:

$$S_2 = \{(x, y - \phi(x; \gamma_1)) | (x, y) \in S\}$$

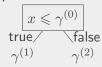

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \ \text{returns} \ \gamma \ \text{minimizing} \ \sum_{(x,y)\in S} (y-\phi(x;\gamma))^2$$

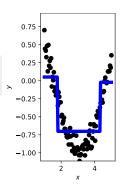

Stump:
$$\phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x\leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x>\gamma^{(0)}}(x)$$

Model: $\phi(x; \gamma_1) + \phi(x; \gamma_2) + \phi(x; \gamma_3)$

Idea

Add a corrective term $\phi(x, \gamma_3)$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \ \text{returns} \ \gamma \ \text{minimizing} \ \sum_{(x,y)\in S} (y-\phi(x;\gamma))^2$$

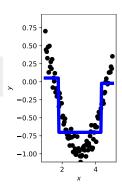

$$\text{Stump: } \phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x\leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x>\gamma^{(0)}}(x)$$

Model:
$$\phi(x; \gamma_1) + \phi(x; \gamma_2) + \phi(x; \gamma_3)$$

 $f_B(x) = \sum_{b=1}^B \phi(x; \gamma_b)$

Idea

Add a corrective term $\phi(x, \gamma_3)$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \text{ returns } \gamma \text{ minimizing } \sum_{(x,y)\in S} (y-\phi(x;\gamma))^2$$

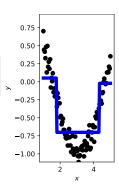

$$\text{Stump: } \phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x\leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x>\gamma^{(0)}}(x)$$

Model:
$$f_2(x) + \phi(x; \gamma_3)$$

 $f_B(x) = \sum_{b=1}^B \phi(x; \gamma_b)$

Idea

Add a corrective term $\phi(x, \gamma_3)$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \text{ returns } \gamma \text{ minimizing } \sum_{(x,y)\in S} (y-\phi(x;\gamma))^2$$

$$\text{Stump: } \phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x\leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x>\gamma^{(0)}}(x)$$

Model:
$$f_2(x) + \phi(x; \gamma_3)$$

 $f_B(x) = \sum_{b=1}^B \phi(x; \gamma_b)$

Idea

Add a corrective term $\phi(x, \gamma_3)$

Choose $\phi(x, \gamma_3)$ minimizing:

$$\sum_{(x,y)\in S} (y - f_2(x) - \phi(x;\gamma_3))^2$$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\mathcal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \text{ returns } \gamma \text{ minimizing } \sum_{(x,y) \in S} (y - \phi(x;\gamma))^2$$

 $\text{Stump: } \phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x \leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x > \gamma^{(0)}}(x)$

Model:
$$f_2(x) + \phi(x; \gamma_3)$$

 $f_B(x) = \sum_{b=1}^{B} \phi(x; \gamma_b)$

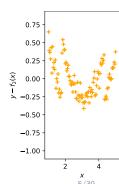

Idea

Add a corrective term $\phi(x, \gamma_3)$

Choose $\phi(x, \gamma_3)$ minimizing:

$$\sum_{(x,y)\in S} (y - f_2(x) - \phi(x;\gamma_3))^2$$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\cal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \ \text{returns} \ \gamma \ \text{minimizing} \ \sum \ (y - \phi(x; \gamma))^2$$

Stump:
$$\phi(x;\gamma) = \gamma^{(1)} \mathbb{1}_{x \leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbb{1}_{x > \gamma^{(0)}}(x)$$

Model:
$$f_2(x) + \phi(x; \gamma_3)$$

 $f_B(x) = \sum_{b=1}^B \phi(x; \gamma_b)$

Idea

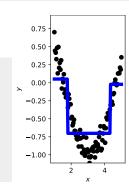

Add a corrective term $\phi(x, \gamma_3)$

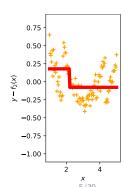

Choose $\phi(x, \gamma_3)$ minimizing:

$$\sum_{(x,y)\in S} (y - f_2(x) - \phi(x;\gamma_3))^2$$

Use $\mathcal A$ on S_3 to get $\phi(x;\gamma_2)$:

$$S_3 = \{(x, y - f_2(x)) | (x, y) \in S\}$$

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\mathcal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \ \text{returns} \ \gamma \ \text{minimizing} \ \sum \ (y - \phi(x; \gamma))^2$$

$$\text{Stump: } \phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x \leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x > \gamma^{(0)}}(x)$$

Model:
$$f_2(x) + \phi(x; \gamma_3)$$

 $f_B(x) = \sum_{b=1}^B \phi(x; \gamma_b)$

Idea

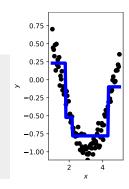

Add a corrective term $\phi(x, \gamma_3)$

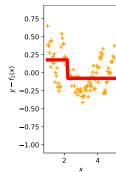

Choose $\phi(x, \gamma_3)$ minimizing:

$$\sum_{(x,y)\in S} (y - f_2(x) - \phi(x;\gamma_3))^2$$

Use \mathcal{A} on S_3 to get $\phi(x; \gamma_2)$:

$$S_3 = \{(x, y - f_2(x)) | (x, y) \in S\}$$

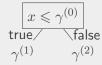

"Weak" Learning Algorithm Used in This Illustration

We have a learning algorithm ${\mathcal A}$ such that:

$$\forall S, \ \mathcal{A}[S] \ \text{returns} \ \gamma \ \text{minimizing} \sum_{(x,y) \in S} (y - \phi(x;\gamma))^2$$

Stump:
$$\phi(x;\gamma) = \gamma^{(1)} \mathbbm{1}_{x\leqslant \gamma^{(0)}}(x) + \gamma^{(2)} \mathbbm{1}_{x>\gamma^{(0)}}(x)$$

Model:
$$f_3(x)$$

 $f_B(x) = \sum_{b=1}^{B} \phi(x; \gamma_b)$

Idea

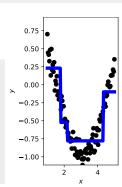

Add a corrective term $\phi(x, \gamma_3)$

Choose $\phi(x, \gamma_3)$ minimizing:

$$\sum_{(x,y)\in S} \left(y - f_2(x) - \phi(x;\gamma_3)\right)^2$$

Use \mathcal{A} on S_3 to get $\phi(x; \gamma_2)$:

$$S_3 = \{(x, y - f_2(x)) | (x, y) \in S\}$$

Forward Stagewise Additive Model (FSAM)

Idea

At each step, sum a model correcting the error made

$$f_B(x) = \sum_{b=1}^{B} \phi(x; \gamma_b)$$

where $x\mapsto \phi(x;\gamma)$ is a "simple" model parametrized by γ

Algorithm 1 Forward Stagewise Additive Model: Incremental Tuning

- 1: Initialize $f_0: \mathbf{x} \to 0$
- 2: **for** b = 1 to B **do**
- 3: Compute parameters γ_b minimizing loss ℓ :

$$\gamma_b = \arg\min_{\gamma} \sum_{i=1}^{N} \ell(\mathbf{y}_i, f_{b-1}(\mathbf{x}_i) + \phi(\mathbf{x}_i; \gamma))$$

 \triangleright use of ${\mathcal A}$

- 4: $f_b: x \to f_{b-1}(x) + \phi(x; \gamma_b)$
- 5: end for

Greedy approach:

The parameters obtained $(\gamma_1,\ldots,\gamma_B)$ gives a low value for ℓ , not the lowest one.

Differences and Similarity Between Bagging and Boosting

Similarity

Both are sums of models fitted using a learning algorithm ${\cal A}$

Differences

Bagging:

- Reduces the variance
- Models can be trained in parallel
- Each model solves same ML problem
- lacktriangle Large B reduces overfit but

$$\lim_{B\to +\infty} \frac{1}{B} \sum_{b=1}^{B} \mathcal{A}[S_b] \text{ can overfit}$$

Boosting:

- Reduces the bias
- Models trained sequentially
- Each model trained on ≠ problem
- Large B leads to overfit

Choice of $\mathcal{A}/\phi(.;\gamma)$ for Boosting ?

Use Boosting with Low Bias Algorithm is Not a Good Idea?

- High bias learning algorithm are usually faster
- lacktriangle Choosing the number of models B (fitted by a high bias algorithm) can be used to control overfit

Very Common \rightarrow **Tree**

- Stump or more generally trees with a small number nodes
- In combination with Gradient Boosting, very efficient method

Not Very Common

- Splines: piecewise polynomial with continuity constraints
- Shallow neural network ([Badirli et al., 2020])
- Linear models
 - Boosted linear models are linear models
 - Full linear model **not** useful for quadratic loss
 - Univariate linear model with most correlated: behavior close to LASSO

Let us consider an input $x \in \mathbb{R}^P$ with P features $x_{.,1},\ldots,x_{.,P}$. The additive model is:

$$f_B(x) = \sum_{b=1}^{B} \phi(x; \gamma_b)$$

Boosted Model Using Stumps

$$f_B(x) = \sum_{p=1}^{P} \eta_p(x_{\cdot,p})$$

No non-linear interaction between two different features!

Let us consider an input $x \in \mathbb{R}^P$ with P features $x_{.,1}, \ldots, x_{.,P}$

The additive model is:

$$f_B(x) = \sum_{b=1}^{B} \phi(x; \gamma_b)$$

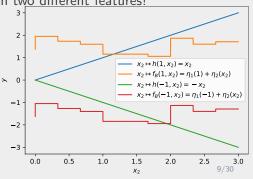

Boosted Model Using Stumps

$$f_B(x) = \sum_{p=1}^{P} \eta_p(x_{.,p})$$

No non-linear interaction between two different features!

True model: $h(x_1, x_2) = x_1 x_2$ Boosted model:

$$f_B(x_1, x_2) = \eta_1(x_1) + \eta_2(x_2)$$

Let us consider an input $x \in \mathbb{R}^P$ with P features $x_{.,1}, \ldots, x_{.,P}$

The additive model is:

$$f_B(x) = \sum_{b=1}^{B} \phi(x; \gamma_b)$$

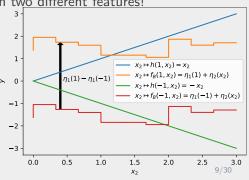

Boosted Model Using Stumps

$$f_B(x) = \sum_{p=1}^{P} \eta_p(x_{.,p})$$

No non-linear interaction between two different features!

True model: $h(x_1,x_2)=x_1x_2$ Boosted model:

$$f_B(x_1, x_2) = \eta_1(x_1) + \eta_2(x_2)$$

Let us consider an input $x \in \mathbb{R}^P$ with P features $x_{.,1}, \ldots, x_{.,P}$. The additive model is:

$$f_B(x) = \sum_{b=1}^{B} \phi(x; \gamma_b)$$

Boosted Model Using Stumps

$$f_B(x) = \sum_{p=1}^{P} \eta_p(x_{.,p})$$

No non-linear interaction between two different features!

Boosted Model Using Small Trees with J Nodes

For each tree $\phi(x; \gamma_b)$ at most J features actually used

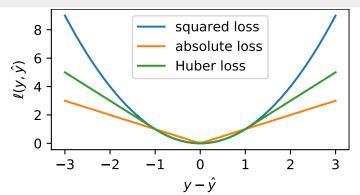

$$f_B(x) = \sum_{p_1,\dots,p_J} \eta_{(p_1,\dots,p_J)}(x^{(p_1)},\dots,x^{(p_J)})$$

At most J features can interact!

Choice of Loss ℓ ?

Losses for Regression

- Squared loss: $\ell(y, \hat{y}) = (y \hat{y})^2 \rightarrow \arg\min_{c} \sum_{i=1}^{N} \ell(y_i, c) = \max(y_{1...N})$
- Absolute loss: $\ell(y, \hat{y}) = |y \hat{y}| \rightarrow \arg\min_{c} \sum_{i=1}^{n} \ell(y_i, c) = \operatorname{median}(y_{1...N})$
- Huber loss [1964]: $\ell(y,\hat{y}) = (y-\hat{y})^2$ if $|y-\hat{y}| \leqslant \delta$ else $2\delta|y-\hat{y}| \delta^2$

10/30

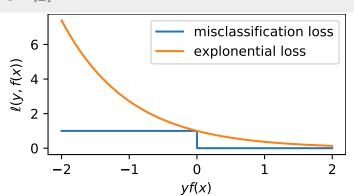

Choice of Loss ℓ ?

Losses for Binary Classification: $y \in \{-1, 1\}$

 $\hat{y} = \operatorname{sign}(f(x)), \text{ with } f(x) \in \mathbb{R}$

- Misclassification loss: $\ell(y, f(x)) = \mathbb{1}_{]-\infty;[0]}(yf(x))$
- **Exponential loss:** $\ell(y, f(x)) = \exp(-yf(x))$

$$\rightarrow \arg\min_{c} \sum_{i=1}^{N} \ell(y_i, c) = \frac{1}{2} \log \frac{\mathsf{Proportion}(y_i = 1; i \in \llbracket 1; N \rrbracket)}{\mathsf{Proportion}(y_i = -1; i \in \llbracket 1; N \rrbracket)}$$

Outline of this session

- 1 Introduction to Boosting
- 2 AdaBoost [Freund and Schapire, 1997]
- 3 Gradient Boosting [Friedman, 2001]
- 4 Gradient Boosted Trees [Friedman, 2001

AdaBoost = FSAM with Exponential Loss and Particular ϕ

Hypothesis

- Binary classification: $y \in \{-1, 1\}$; $\hat{y} = \text{sign}(f(x))$
- Exponential loss: $\ell(y, f(x)) = \exp(-yf(x))$
- ullet $\phi(x; \alpha, \beta) = \alpha \ h(x; \beta)$ with h classifier predicting -1 or 1

We incrementally build
$$f_B(x) = \sum_{b=1}^{B} \phi(x; \alpha_b, \beta_b) = \sum_{b=1}^{B} \alpha_b h(x; \beta_b)$$

FSAM:
$$(\alpha_b, \beta_b) = \arg\min_{(\alpha, \beta)} \sum_{i=1}^{N} \ell(y_i, f_{b-1}(x_i) + \phi(x_i; \alpha, \beta))$$

$$\sum_{i=1}^{N} e^{-y_i (f_{b-1}(x_i) + \phi(x_i; \alpha, \beta))} = \sum_{i=1}^{N} \underbrace{e^{-y_i f_{b-1}(x_i)}}_{w_i} e^{-y_i h(x_i; \beta)\alpha}$$
$$= e^{-\alpha} \sum_{i=1}^{N} w_i + (e^{\alpha} - e^{-\alpha}) \underbrace{\sum_{i=1}^{N} w_i \mathbb{1} (y_i \neq h(x_i; \beta))}_{}$$

Nota Bene: $\mathcal A$ minimizes misclassification loss, not exponential loss_{13/30}

Minimized using A

AdaBoost Algorithm [Freund and Schapire, 1997] One of the First Boosting Algorithm (Gödel prize 2003)

- "weak" learner ${\cal A}$ for classification
- input: $T = \{(x_i, y_i, w_i)\}_{i=1,...,N}$ with $y_i \in \{-1, 1\}$
- output: a classifier $\mathcal{A}[T]$ trying minimizing $\sum_{i=1}^n w_i \mathbb{1}\left(y_i \neq \mathcal{A}[T](x_i)\right)$

AdaBoost for binary classification (-1 or 1)

```
1: function AdaBoost(training set:\{(x_i, y_i)\}_{i=1,...,N}, weak learner: \mathcal{A})
```

- $2: \qquad w_{1,\dots,N} \leftarrow 1$
- 3: **for** b = 1 to B **do**
- 4: $h_b \leftarrow \mathcal{A}[\{(x_i, y_i, w_i)\}_{i=1,...,N}]$
- 5: $\operatorname{err}_b \leftarrow \sum_{i=1}^N \tilde{w}_i \mathbb{1} \left(h_b(x_i) \neq y_i \right) \text{ where } \tilde{w}_i = \frac{w_i}{\sum_{i=1}^N w_i}$
- 6: $\alpha_b \leftarrow 0.5 \log \frac{1 \operatorname{err}_b}{\operatorname{err}_b}$ 7: For $i = 1, \dots, N$: $w_i \leftarrow w_i \exp(-\alpha_b y_i h_b(x_i))$
- 8: end for
- 9: **return** $f: x \mapsto \operatorname{sign}\left(\sum_{b=1}^{B} \alpha_b h_b(x)\right)$
- 10: end function

Conclusion on AdaBoost

- One of the first efficient boosting algorithm
- Easy to implement
- Only one hyperparameter *B*
- Sensitive to noise and outliers

 $\beta_b = \operatorname{argmin} \|\nabla L(\vec{F}_{b-1}) - \vec{H}_{\beta}\|^2$

Gradient Boosting [Friedman, 2001]

Computing the Model to Add in FSAM

$$\gamma_b = \arg\min_{\mathbf{x}} \sum_{i=1}^n \ell(\mathbf{y}_i, f_{m-1}(\mathbf{x}_i) + \phi(\mathbf{x}_i; \boldsymbol{\gamma}))$$

For some choice of loss ℓ and ϕ , can be a difficult problem

Computing the Model to Add in Gradient Boosting

Gradient Boosting \simeq gradient descent in a functional space

compute direction:
$$\beta_b = \arg\min_{\beta} \sum_{i=1}^n \left(\left[\frac{\partial \ell(\mathbf{y}_i, \hat{\mathbf{y}})}{\partial \hat{\mathbf{y}}} \right]_{\hat{\mathbf{y}} = f_{b-1}(\mathbf{x}_i)} - h(\mathbf{x}_i; \boldsymbol{\beta}) \right)^2$$

compute step:

$$\rho_b = \arg\min_{\rho} \sum_{i=1}^n \ell\left(\mathbf{y}_i, f_{b-1}(\mathbf{x}_i) - \rho h(\mathbf{x}_i; \beta_b)\right)$$

Update additive model:

$$f_b: x \mapsto f_{b-1}(x) - \rho_b h(x; \beta_b)$$

FSAM=GB for
$$\ell(y, \hat{y}) = 0.5(y - \hat{y})^2$$

Outline of this session

- 1 Introduction to Boosting
- 2 AdaBoost [Freund and Schapire, 1997]
- 3 Gradient Boosting [Friedman, 2001]
- 4 Gradient Boosted Trees [Friedman, 2001]

Gradient Boosted Trees [Friedman, 2001]

FSAM with Trees

$$\phi(x; R, c) = \sum_{m=1}^{M} c^{(m)} \mathbb{1}_{R^{(m)}}(x) (R_b, c_b) = \arg\min_{i=1}^{m} \sum_{i=1}^{n} \ell(y_i, f_{b-1}(x_i) + \phi(x_i; \mathbf{R}, \mathbf{c}))$$

Can be Seen as a Two-Levels Optimization Problem:

- Find regions R_b partitioning input space:

 Difficult combinatorial optimization problem, especially for robust loss
- 2 Find values c_b to predict for each region R_b : Easy problem even for robust loss

Idea: Use a mix of GB and FSAM in Two Steps

I Find regions R_b using the direction as computed in Gradient Boosting:

$$(R_{b,-}) = \arg\min_{(\mathbf{R}, \mathbf{c})} \sum_{i=1}^{n} \left(\left[\frac{\partial \ell(\mathbf{y}_{i}, \hat{\mathbf{y}})}{\partial \hat{\mathbf{y}}} \right]_{\hat{\mathbf{y}} = f_{b-1}(\mathbf{x}_{i})} - \phi(\mathbf{x}_{i}; \mathbf{R}, \mathbf{c}) \right)^{2}$$

2 Find values c_b using FSAM:

$$c_b = \arg\min \sum_{i=1}^n \ell(y_i, f_{b-1}(x_i) + \phi(x_i; R_b, \mathbf{c}))$$

Gradient Boosted Trees [Friedman, 2001]

Gradient Boosted Trees is actually a mix of GB and FSAM

Gradient Boosted Trees

- 1: Initialize $f_0: \mathbf{x} \to \arg\min_{v} \sum_{i=1}^n \ell\left(y_i, v\right) \qquad \triangleright \max(y_{1, \dots, n})$ if quadratic loss
- 2: **for** b = 1 to B **do**
- 3: Compute regions R_b by fitting the gradient of ℓ on the training set:

$$(R_{b,-}) = \underset{(\mathbf{R},c)}{\operatorname{arg \, min}} \sum_{i=1}^{n} \left(\left[\frac{\partial \ell(\mathbf{y}_{i},\hat{\mathbf{y}})}{\partial \hat{\mathbf{y}}} \right]_{\hat{\mathbf{y}} = f_{b-1}(\mathbf{x}_{i})} - \phi(\mathbf{x}_{i}; \mathbf{R}, \mathbf{c}) \right)^{2}$$

- 4: Compute values c_b by minimizing ℓ : \triangleright more powerful than step size search $c_b = \arg\min \sum_{i=1}^n \ell\left(y_i, f_{b-1}(x_i) + \phi(x_i; R_b, c)\right)$
- 5: $f_b: \mathbf{x} \to f_{b-1}(\mathbf{x}) + \phi(\mathbf{x}; R_b, c_b)$
- 6: end for

Shrinkage Coefficient (Learning Rate) ν

$$f_b: x \to f_{b-1}(x) + \nu \phi(x; R_b, c_b), (0 < \nu \le 1)$$

ightarrow Smaller u favor better test error but requires larger B

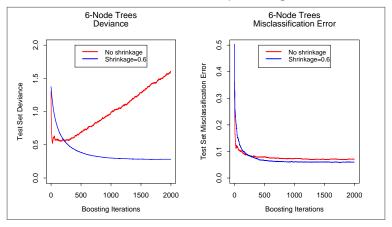

Figure from [Friedman et al., 2001] plotting the deviance loss $\log(1+\exp(-2yf(x)))$ used to train the model and the misclassification error

Subsampling fraction η : Stochastic Gradient Descent

At each boosting step, only a fraction η of the data is used (randomly selected at each iteration without replacement) to obtain the tree

→ Faster and ultimately more accurate

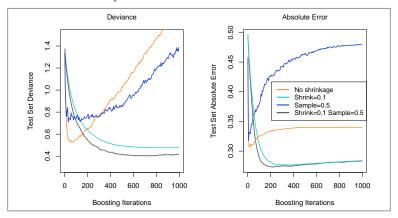

Figure from [Friedman et al., 2001] plotting the deviance loss $\log(1+\exp(-2yf(x)))$ and the absolute error for two different problems $_{28/30}$

Hyper-parameters Tuning and Performance

Most Important Hyper-parameters

- B: number of trees (thousands, fixed value)
- J: number of nodes ($4 \le J \le 8$)
- ν : shrinkage factor or learning rate (between 10^{-3} and 10^{-2})
- \blacksquare η : subsampling fraction (0.5, lower if lots of data, higher if few data)

Advantage/Disadvantage

No preprocessing required Can optimize robust loss Very flexible Lots of hyper-parameters Requires extensive tuning Computationally intensive

Performance

Efficient libraries: LightGBM, XGBoost and CatBoost

One of the most powerful method on "tabular data" / "unstructured data"

My two cents' worth ranking:

 ${\it gradient\ boosted\ trees} > {\it random\ forest} > {\it bagging\ of\ trees} > {\it single\ tree}$
